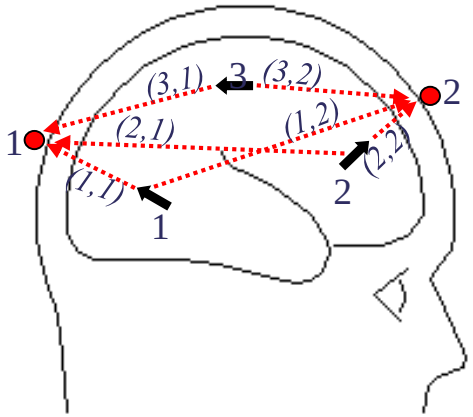
Spatial Resolution of EEG/MEG – Basic Concepts

Resolution Matrix, Point-Spread and Cross-Talk Functions (PSFs and CTFs)

The EEG/MEG Forward Problem



data “leadfield” dipoles

$$\begin{pmatrix} d_1 \\ d_2 \end{pmatrix} = \begin{pmatrix} 0.5 & 0 & 0.3 \\ 0 & 1 & -0.3 \end{pmatrix} \begin{pmatrix} j_1 \\ j_2 \\ j_3 \end{pmatrix}$$

?

inversion

dipoles inverse data

$$\begin{pmatrix} j_1 \\ j_2 \\ j_3 \end{pmatrix} = \begin{pmatrix} 1.5034 & 0.1241 \\ 0.2483 & 0.9379 \\ 0.8276 & -0.2069 \end{pmatrix} * \begin{pmatrix} d_1 \\ d_2 \end{pmatrix}$$

$j_1 + j_2 = 1$

under-determined problem, no unique solution

d=Lj

d: data (n_sensors x 1) **L**: “leadfield” (n_sensors x n_dipoles), **j**: dipoles (n_dipoles x 1)

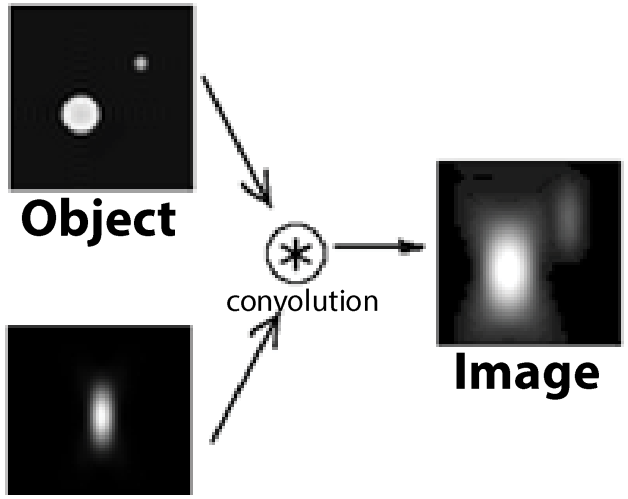
Usually n_dipoles >> n_sensors.

Let’s Start Again:
The “Blurry Image” Analogy

Just because the brain is complicated doesn’t mean source estimation has to be complicated

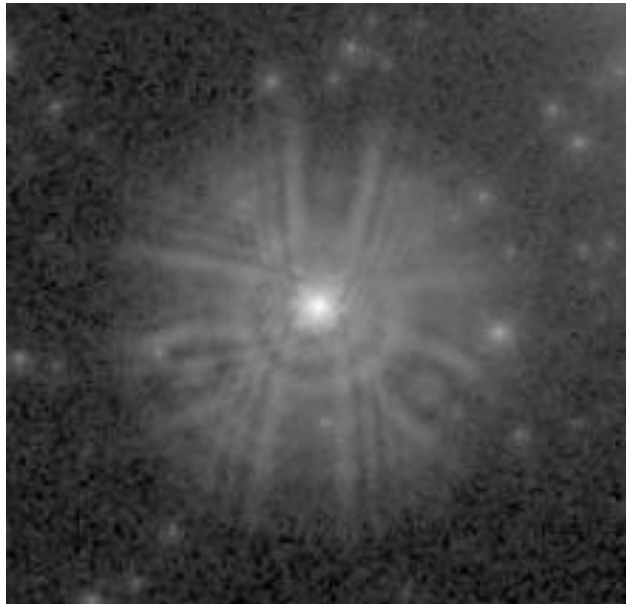
The Superposition Principle
A “Constraint-Free” Interpretation of Linear Methods

Microscopy



Point-Spread Function
PSF

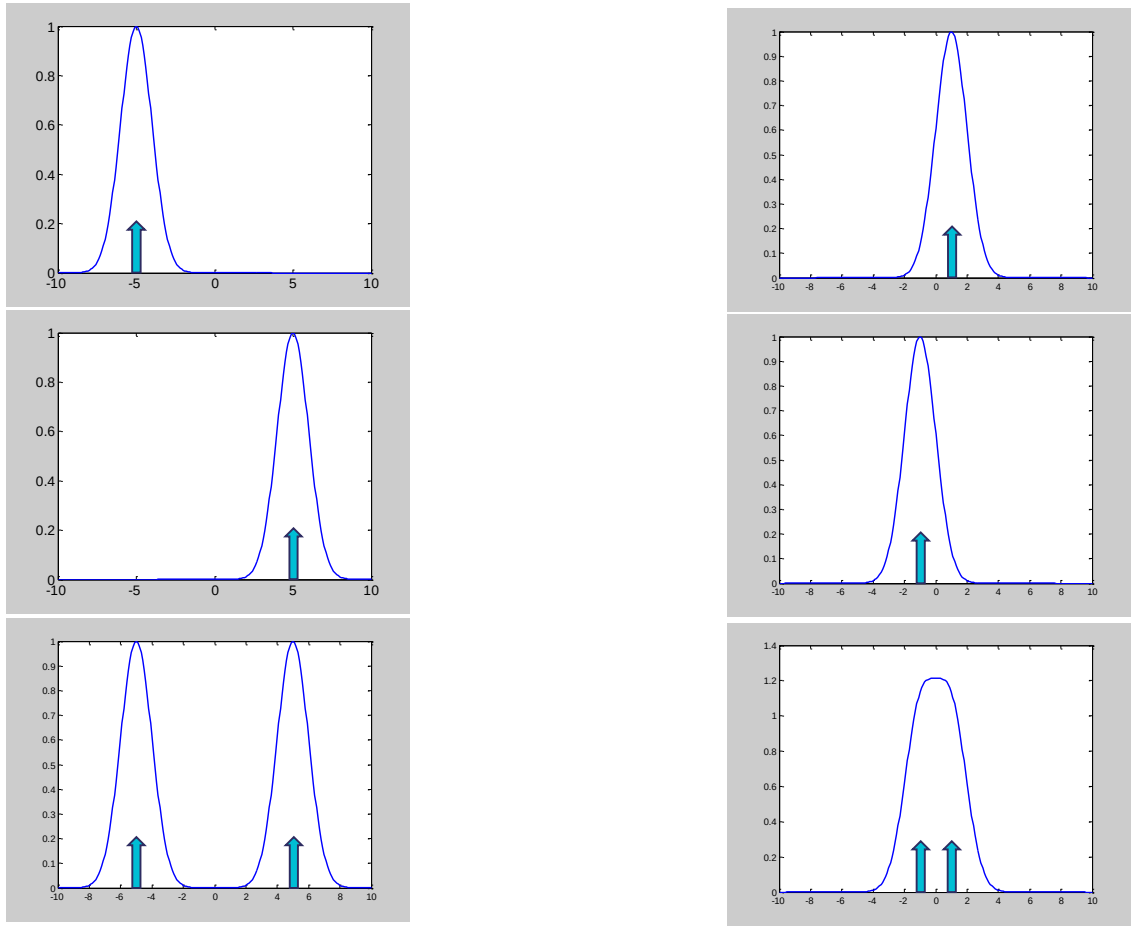
Astronomy



https://en.wikipedia.org/wiki/Point_spread_function

Linear Methods Can Easily Tell Us If They Do What We Want

Superposition Principle



If you know the behaviour for point sources,
you can predict the behaviour for complex sources.

Spatial Resolution of Source Estimation Is Complex

Spatial resolution depends on:

number of sensors (EEG/MEG or both)

source location

source orientation

signal-to-noise ratio

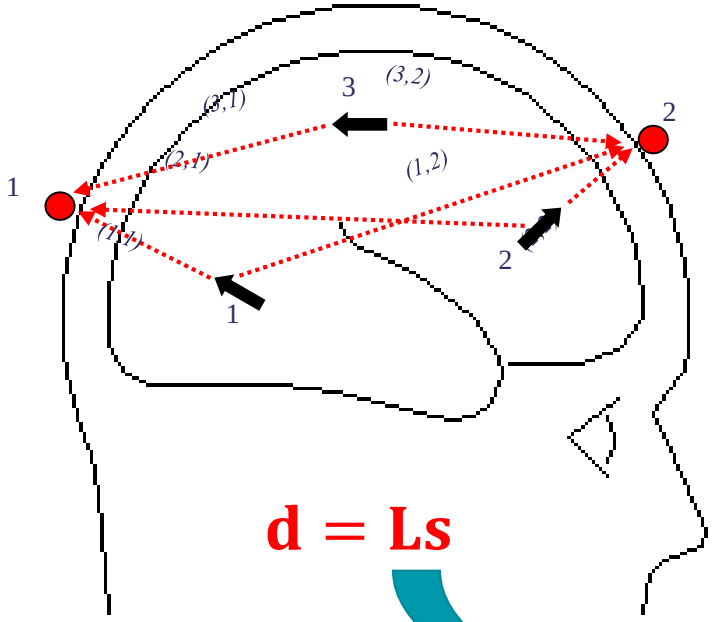
head modelling

assumptions about the sources

=> difficult to make general statement

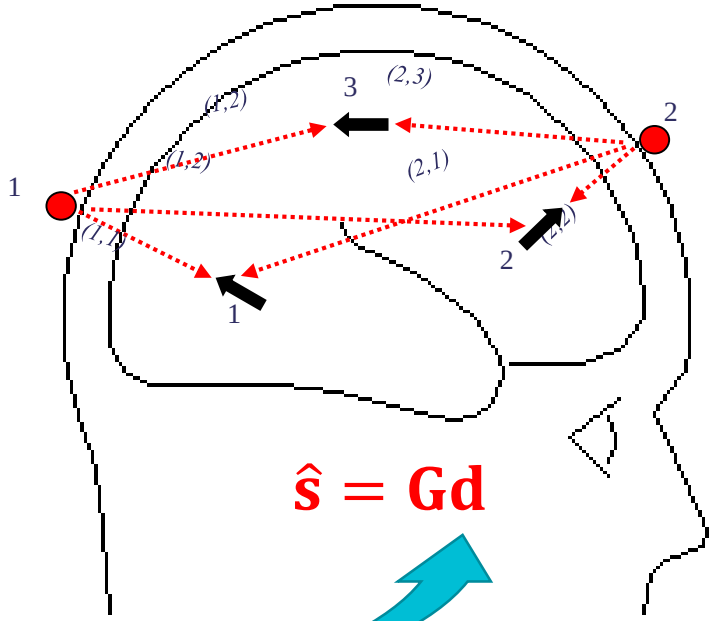
The Resolution Matrix

Forward Problem



$$\mathbf{d} = \mathbf{Ls}$$

Linear Inverse Problem



$$\hat{\mathbf{s}} = \mathbf{Gd}$$

$$\hat{\mathbf{s}} = \mathbf{GLs} \stackrel{\text{def}}{=} \mathbf{Rs}$$

Relationship between estimated and true source distribution.

e.g. Hauk/Stenroos/Treder, bioRxiv 2019
https://www.biorxiv.org/content/10.1101/672956v1

Creating an Optimal Resolution Matrix

$$\hat{\mathbf{s}} = \mathbf{R}\mathbf{s}$$

The closer **R** is to the identity matrix, the closer our estimate is to the true source.

Therefore, let us minimise the difference between **R** and the identity matrix in the least-squares sense:

$$\|\boldsymbol{R} - \boldsymbol{I}\|_2 = min$$

This leads to the **Minimum Norm Estimator (MNE)**:

$$\boldsymbol{G_{MN}} = \mathbf{L}^T(\mathbf{L}\mathbf{L}^T)^{-1}$$

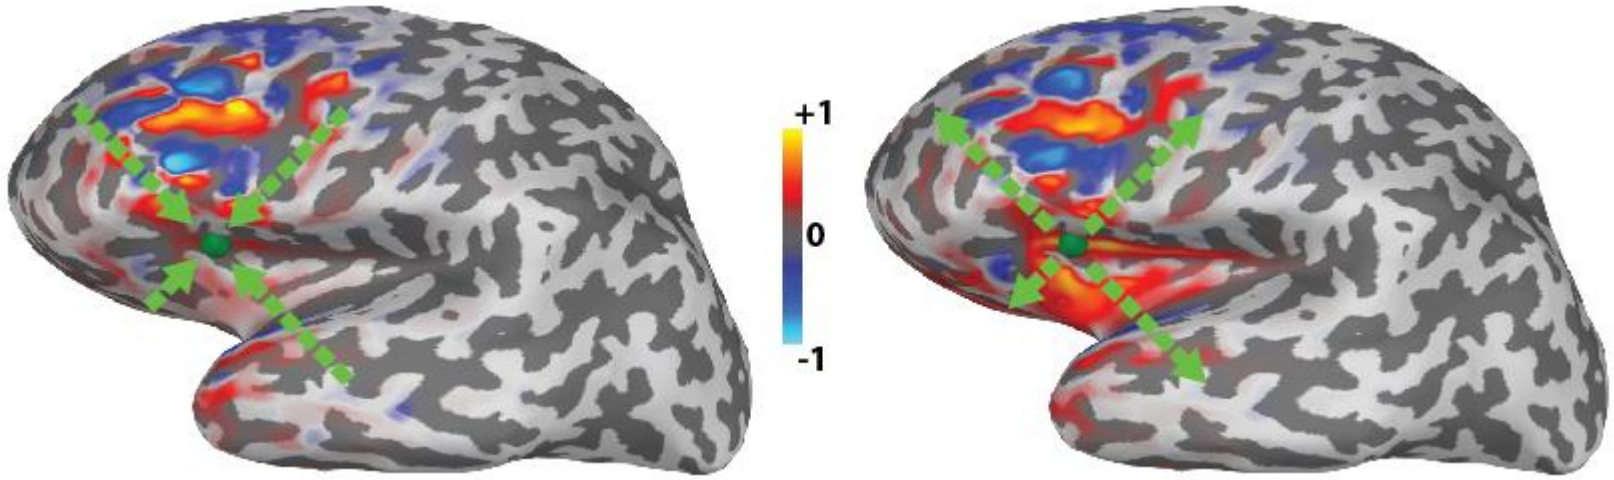
Its resolution matrix $\boldsymbol{R_{MN}} = \mathbf{L}^T(\mathbf{L}\mathbf{L}^T)^{-1}\mathbf{L}$ is symmetric.

e.g. Hauk/Stenroos/Treder, bioRxiv 2019
https://www.biorxiv.org/content/10.1101/672956v1

Spatial Resolution / Leakage:

Point-Spread and Cross-Talk

Cross-Talk Function
(CTF)



How other sources may affect the estimate for this source

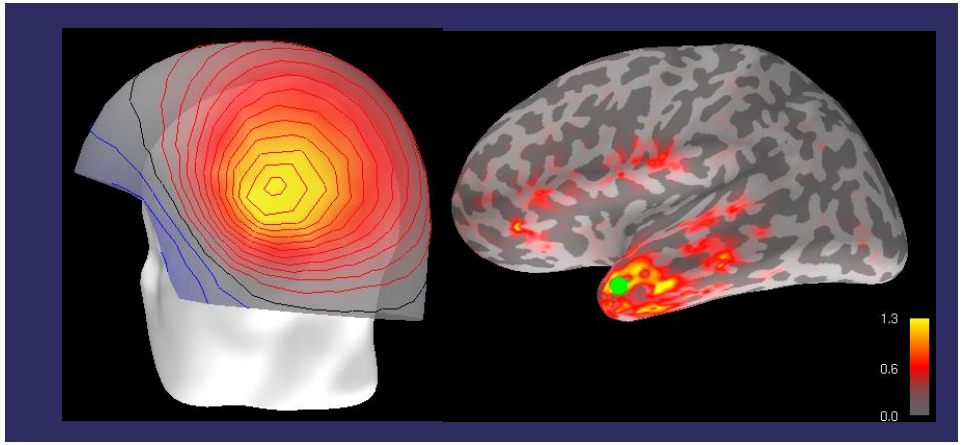
Point-Spread Function
(PSF)

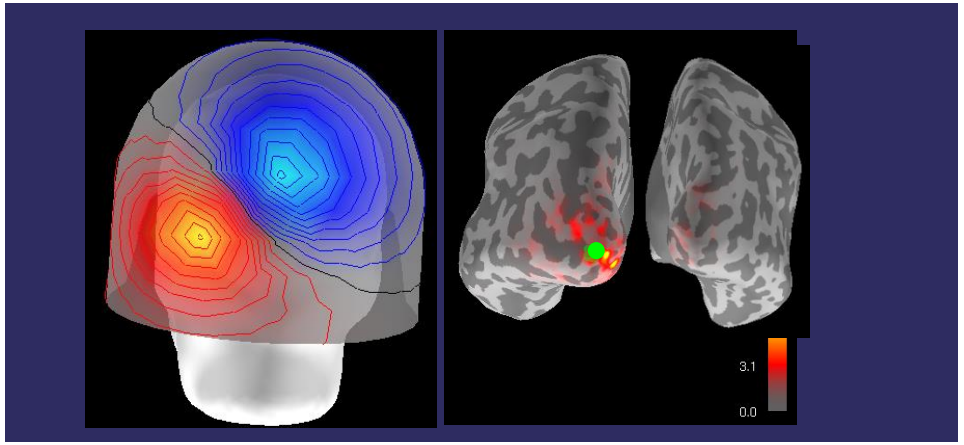
How this source affects estimates for other sources

e.g. Hauk, Stenroos, Treder, Neuroimage 2022
https://www.sciencedirect.com/science/article/pii/S1053811922002993

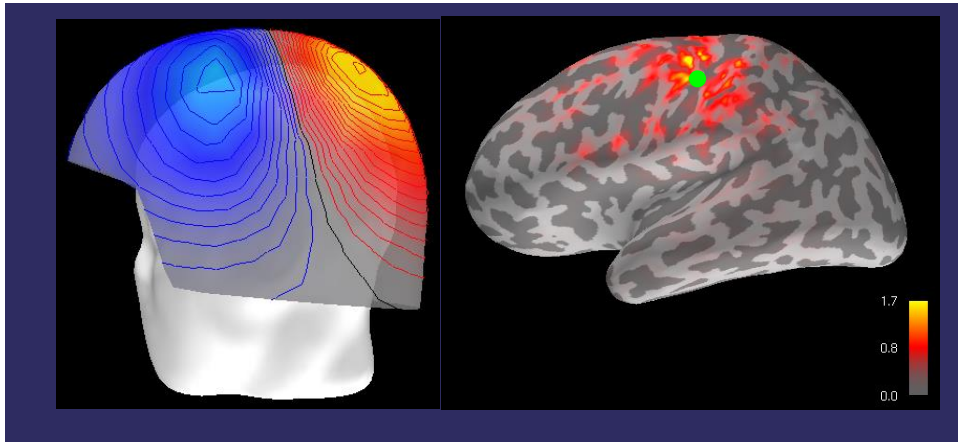
PSFs and CTFs for Some ROIs

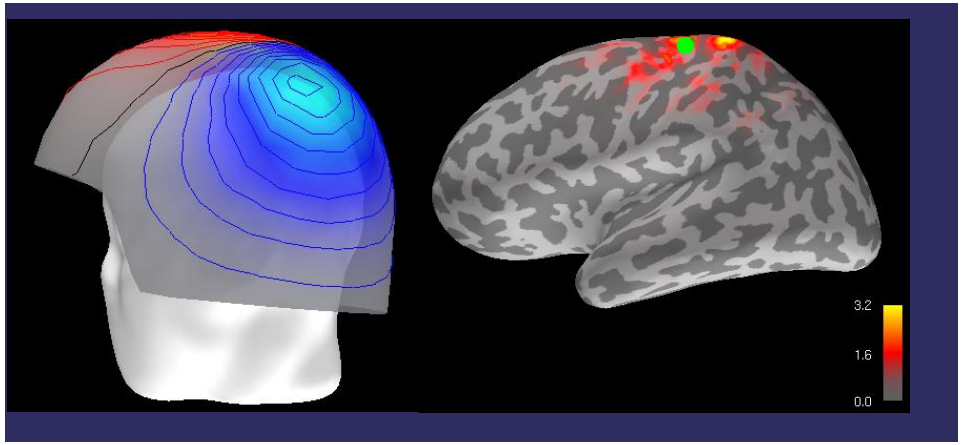
For MNE, PSFs and CTFs turn out to be the same





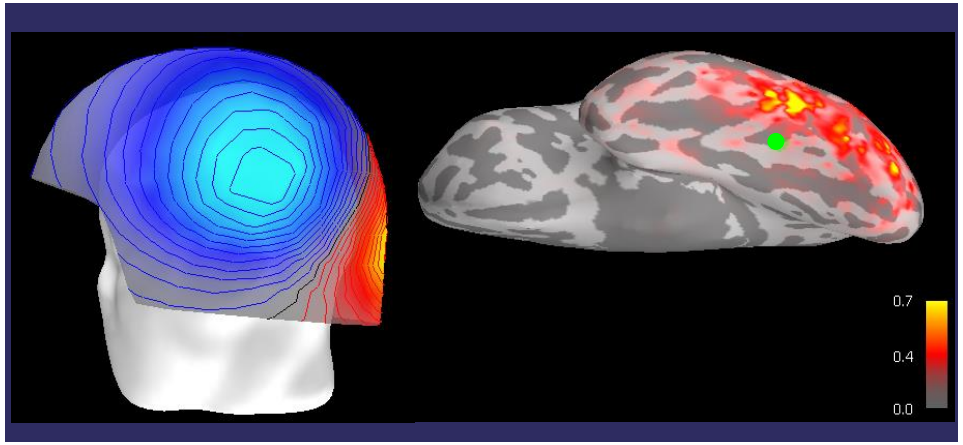
Good

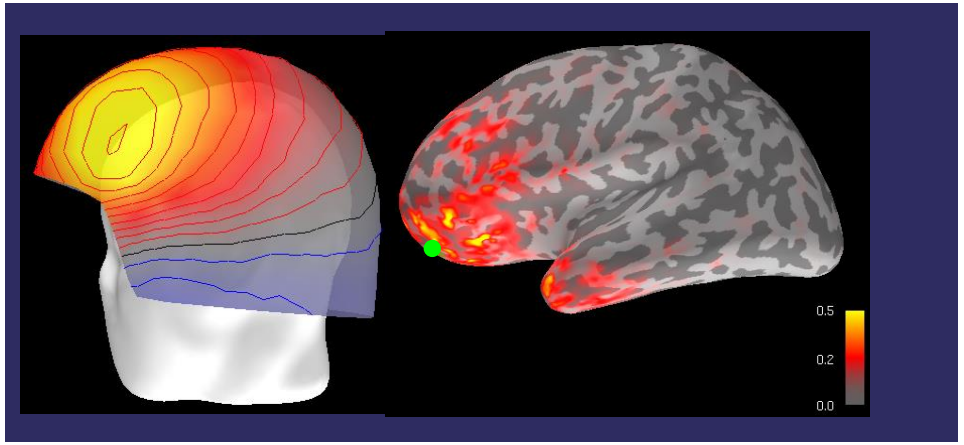




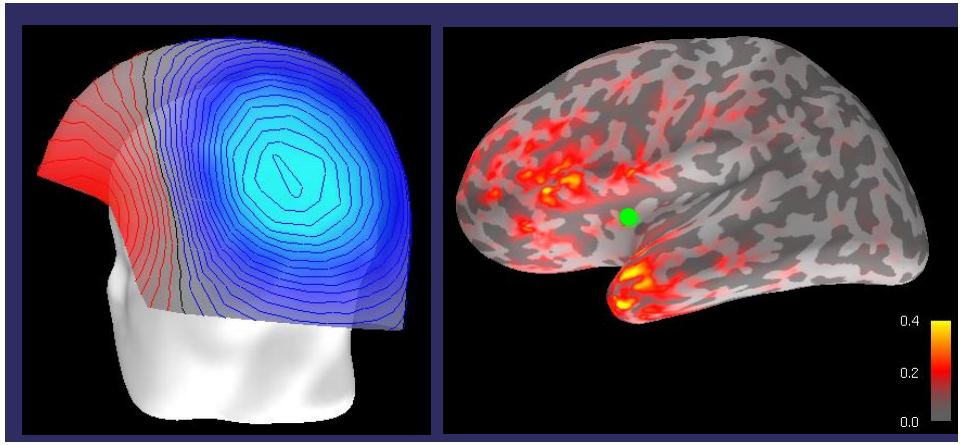
PSFs and CTFs for Some ROIs

For MNE, PSFs and CTFs turn out to be the same



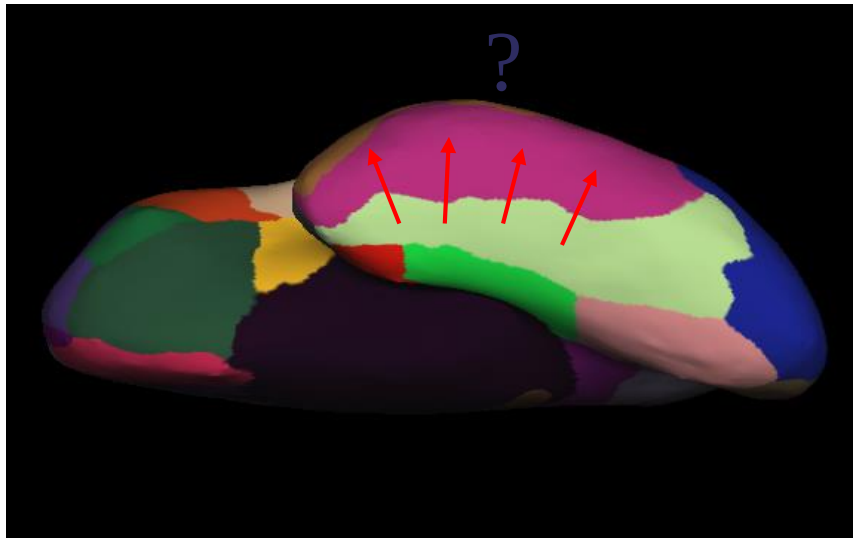


Less good

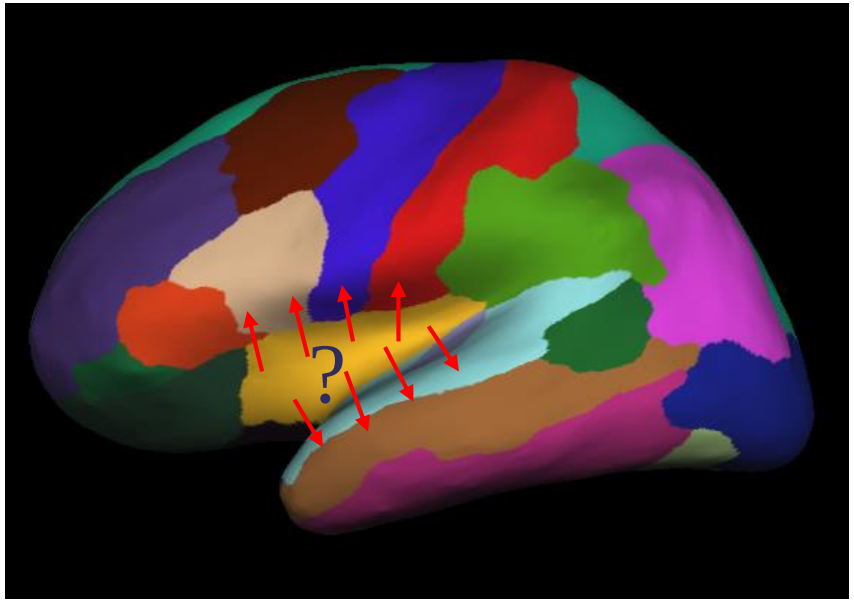


Localisation Bias Has Consequences for ROI analysis

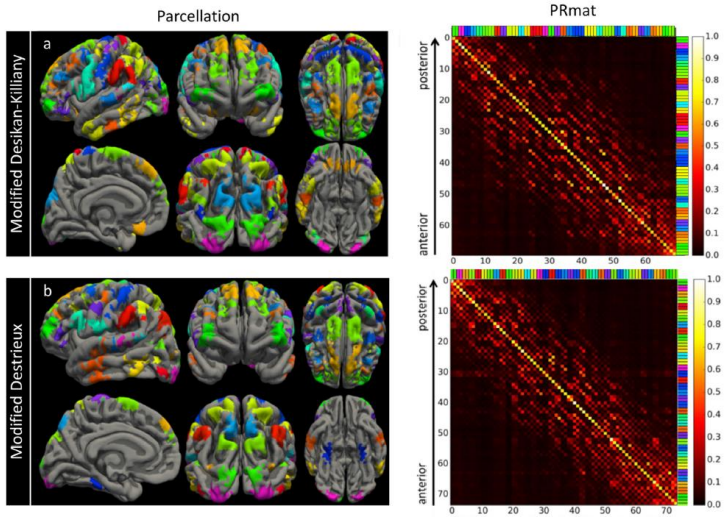
PSFs/CTFs Can Tell You How It Looks Like



Desikan-Killiany Atlas parcellation



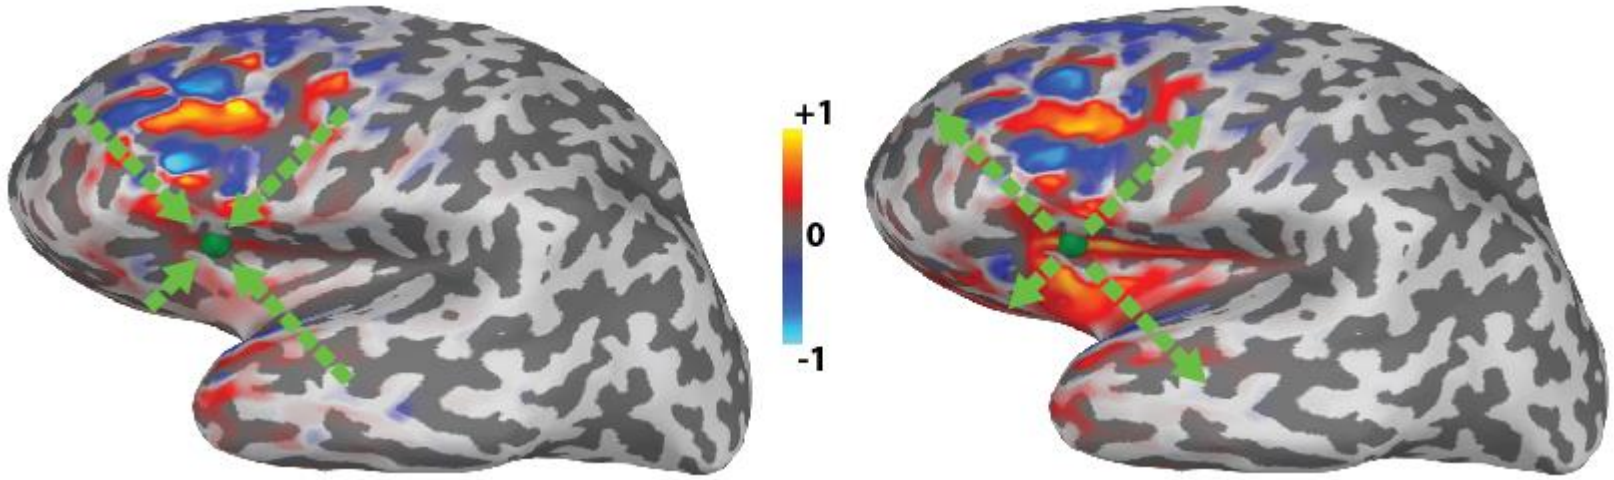
Adaptive cortical parcellation based on resolution matrix are possible: Farahibozorg/Henson/Hauk NI 2018
https://pubmed.ncbi.nlm.nih.gov/28893608/



Spatial Resolution / Leakage:

Point-Spread and Cross-Talk

Cross-Talk Function
(CTF)



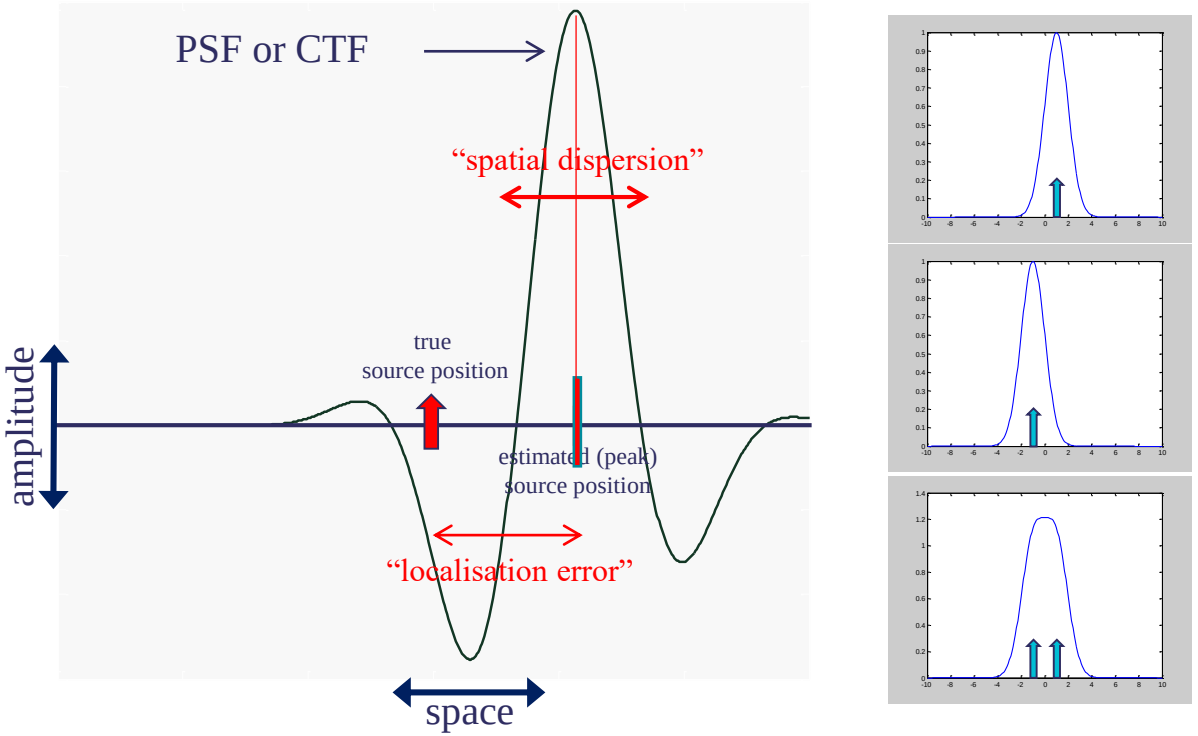
How other sources may affect the estimate for this source

Point-Spread Function
(PSF)

How this source affects estimates for other sources

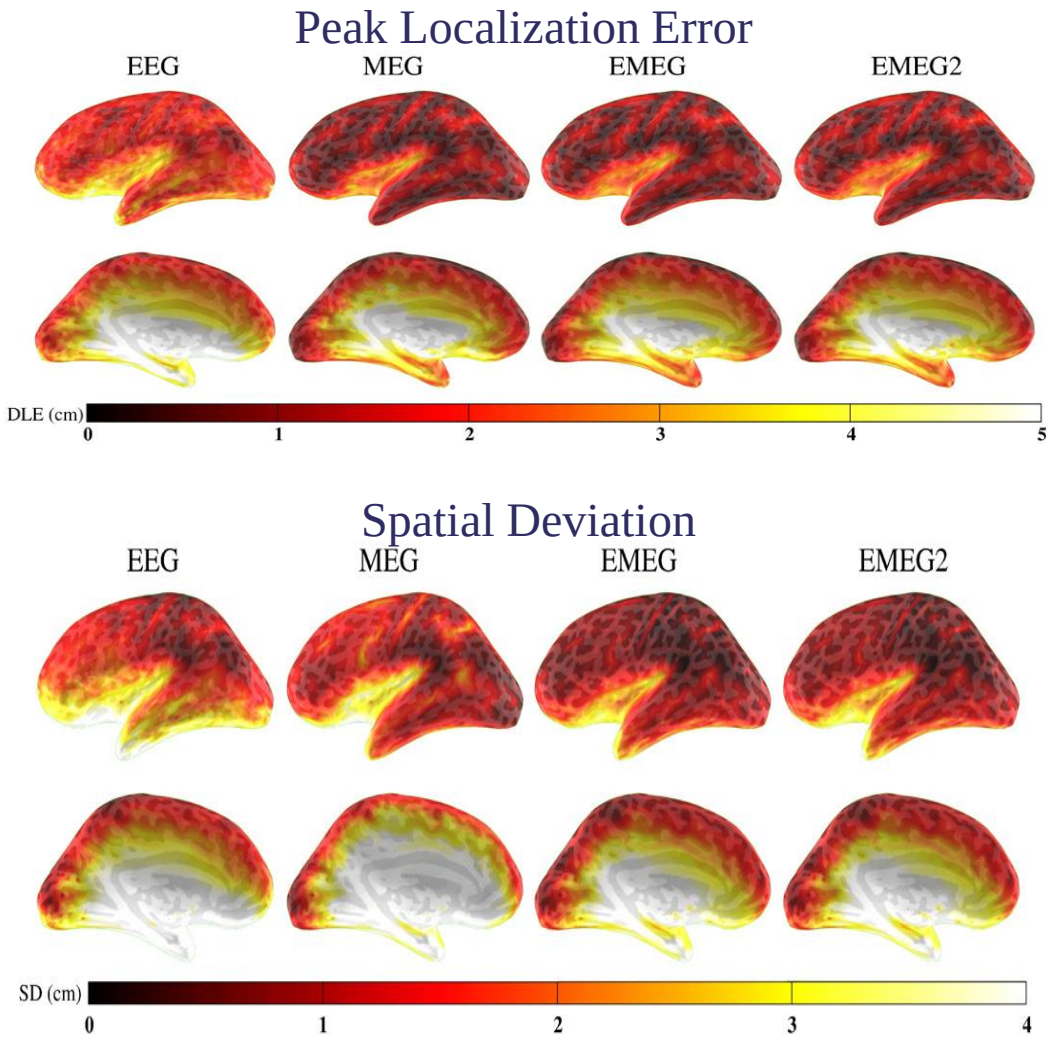
e.g. Hauk, Stenroos, Treder, Neuroimage 2022
https://www.sciencedirect.com/science/article/pii/S1053811922002993

Quantifying Resolution From PSFs and CTFs



It's not just peak localisation that counts,
but also spatial extent of the distribution.

Whole-Brain Maps of Resolution Metrics

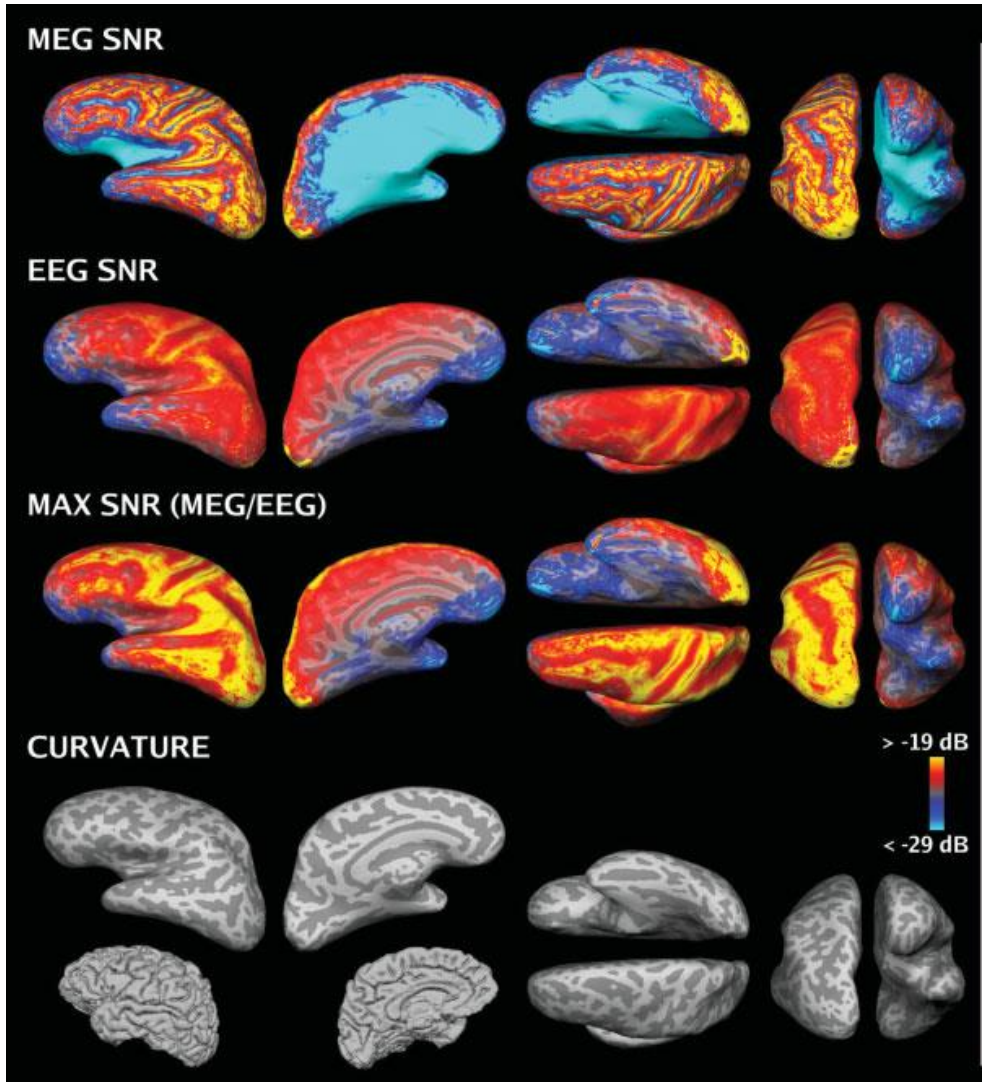


Combining EEG and MEG improves spatial resolution.

Molins et al., Neuroimage 2008
https://pubmed.ncbi.nlm.nih.gov/18602485/

Sensitivity Maps

Sensor type, coverage and distance to sources strongly affect sensitivity and spatial resolution



Goldenholz et al., HBM 2009
https://pubmed.ncbi.nlm.nih.gov/18465745/

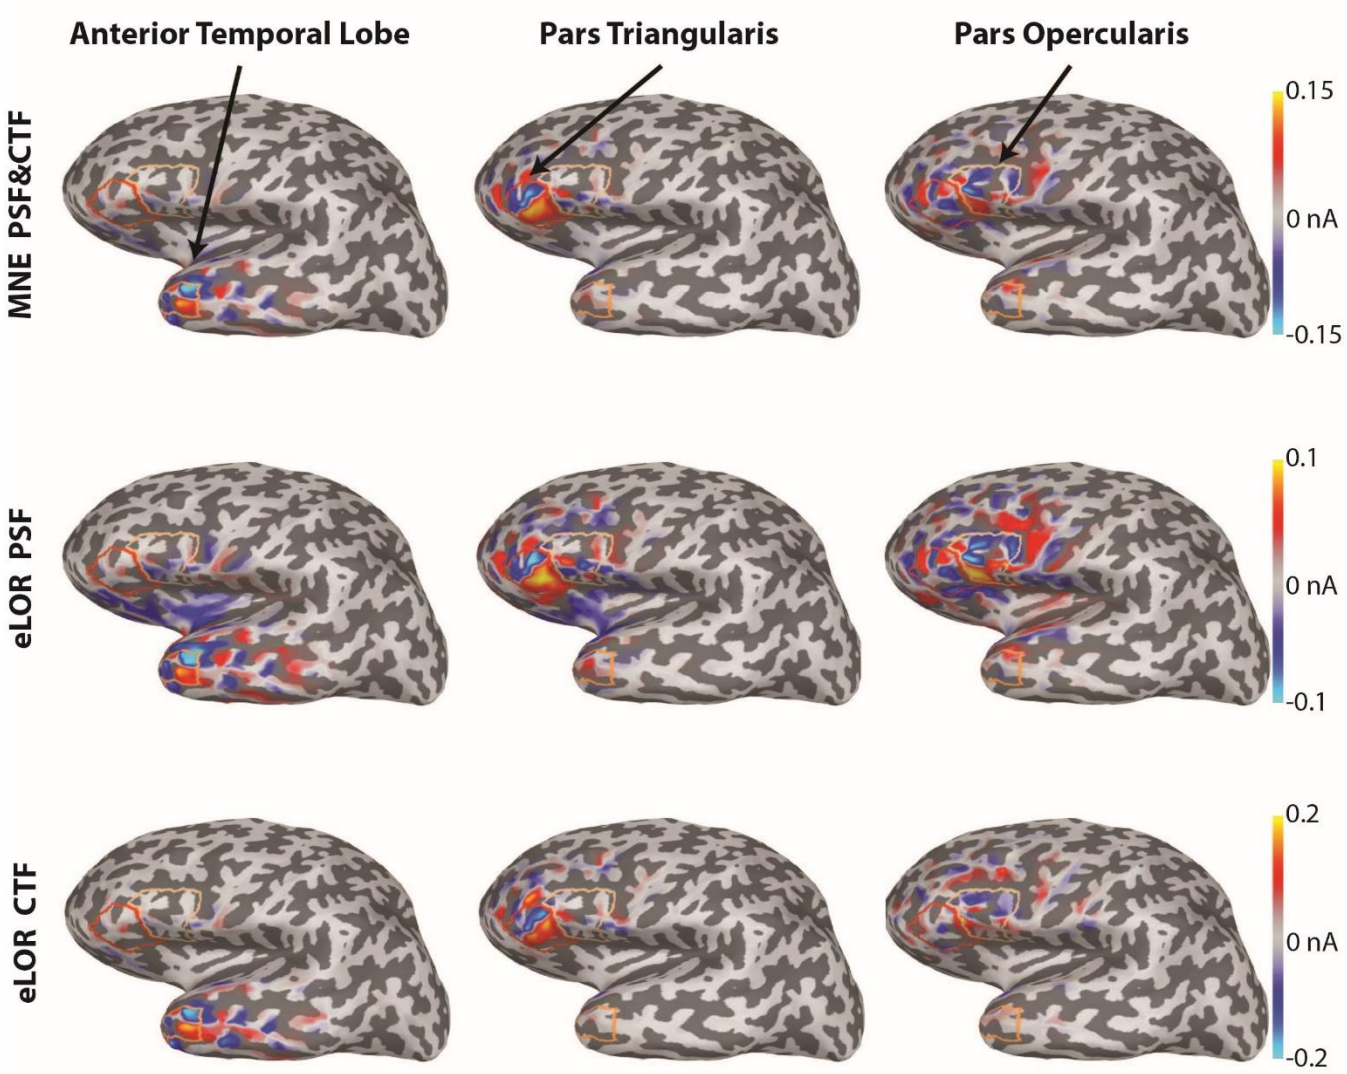
Methods Comparison

- **MEG+EEG**: Elekta Vectorview (360+70 channels), Wakeman & Henson open data set
- **Methods**:
  - L2-MNE
  - depth-weighted L2-MNE
  - dSPM
  - e/sLORETA
  - 2 LCMV beamformers (pre- and post-stimulus covariance matrices)
- **Resolution Metrics**:
  - Peak Localisation Error
  - Spatial Deviation (extent)

Hauk, Stenroos, Treder, Neuroimage 2022
https://www.sciencedirect.com/science/article/pii/S1053811922002993

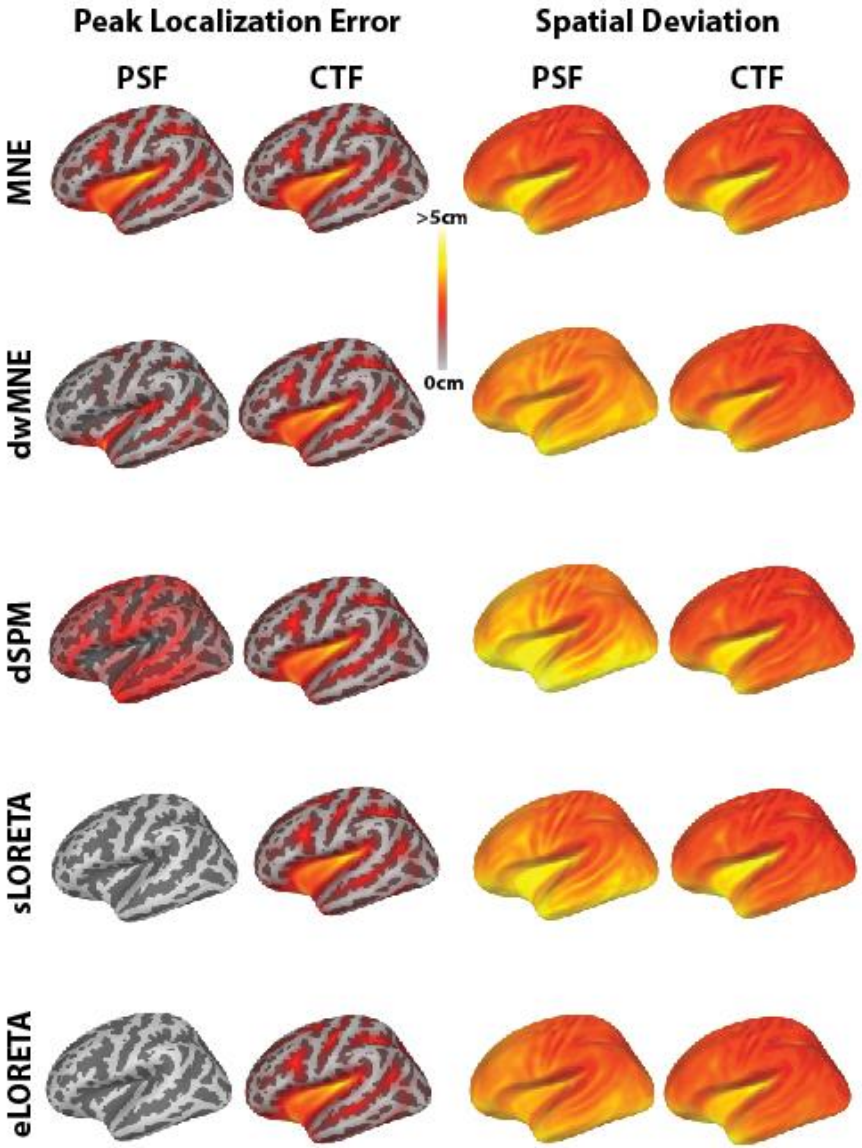
Example PSFs and CTFs for MNE and eLORETA

Note: For MNE PSFs and CTFs are the same



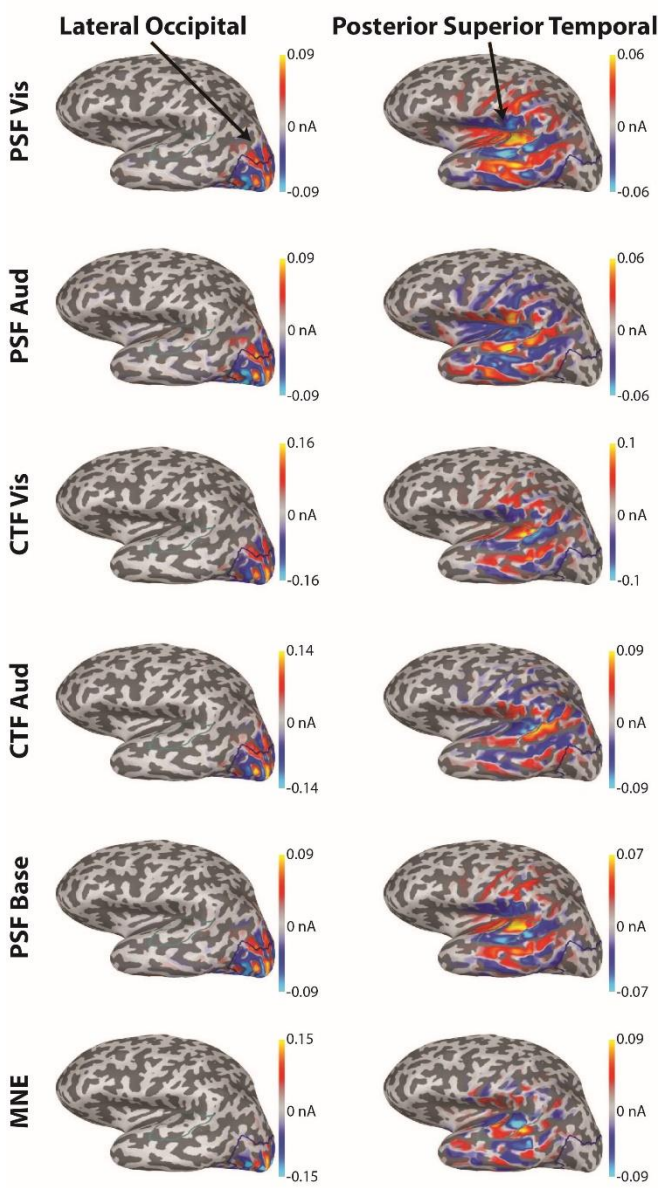
Hauk, Stenroos, Treder, Neuroimage 2022
https://www.sciencedirect.com/science/article/pii/S1053811922002993

Comparing Estimators – MNE-type methods



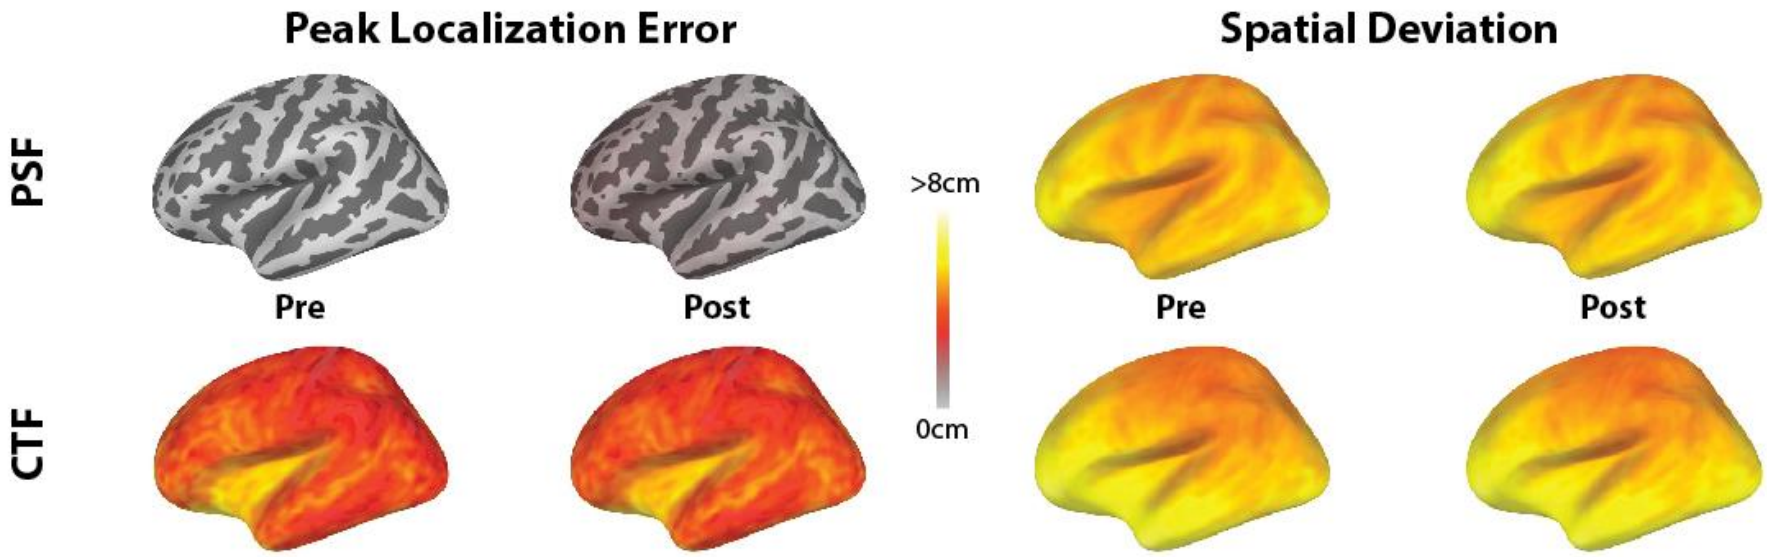
Hauk, Stenroos, Treder, Neuroimage 2022
https://www.sciencedirect.com/science/article/pii/S1053811922002993

Example PSFs and CTFs for Beamformers



Hauk, Stenroos, Treder, Neuroimage 2022
https://www.sciencedirect.com/science/article/pii/S1053811922002993

Comparing Estimators – Beamformers



Hauk, Stenroos, Treder, Neuroimage 2022
https://www.sciencedirect.com/science/article/pii/S1053811922002993

Conclusion From Methods Comparison

- Methods vary with respect to localisation error and spatial deviation.
- Improvements in localization error are accompanied by increases in spatial deviation.
- Localisation error for PSFs can be minimised (even to zero), but not for CTFs.
- Spatial deviation for PSFs and CTFs cannot be minimised beyond a certain limit.
- Localisation error for beamformers is low (even zero), but spatial deviation higher than for MNE-type methods.
- Performance of beamformers similar for different covariance matrices.

$\Rightarrow$ There is no obvious “best method”.

$\Rightarrow$ In this analysis, MNE and eLORETA seem to offer the best compromise between localisation and spatial deviation.

$\Rightarrow$ The tools (PSFs/CTFs, resolution metrics) can be applied to individual datasets – try it yourself!

Thank you
